SUMMARY

Final-year B.Tech Computer Science (Cyber Security) student targeting a Cyber Security Analyst role at Infosys. Hands-on with vulnerability assessment, network security, and threat analysis on Kali Linux; built AI-driven security tooling for automated code review with 0–100 CVSS-style risk scoring. Grounded in SOC and VAPT fundamentals — TCP/IP network protocols, firewalls, intrusion detection, malware analysis, and digital forensics — with a strong interest in security operations and ethical hacking.

EDUCATION

VIT Bhopal University	2023 – 2027
B.Tech Computer Science Engineering (Cyber Security)	
Delhi Public School, Neelbad	2022
CBSE — Class XII (2022) Class X (2020)	

PROJECTS

AI-Powered Security Vulnerability Scanner

Python, TensorFlow, scikit-learn

- Automated a manual secure-code review workflow by building a static code-analysis tool that scans source code for insecure patterns and flags vulnerabilities for remediation.
- Achieved detection accuracy by training and evaluating a Random Forest classifier on a preprocessed vulnerability dataset of labeled samples.
- Enabled CVSS-style vulnerability prioritization by designing a 0–100 composite risk score, letting developers triage the most critical findings first.

NNIDS — Neural Network Intrusion Detection System

Python, FastAPI, React, Docker

- Delivered a real-time network threat-detection platform end to end — architecture, implementation, testing, Dockerized deployment, and live monitoring — via FastAPI REST APIs and a React/Vite dashboard with WebSockets.
- Broadened detection coverage across anomaly, signature, behavioral, and threat-intelligence vectors by building a 7-stage hybrid pipeline (Isolation Forest + rules + heuristics) over per-IP features — packet rate, SYN ratio, port entropy — engineered with Scapy and pandas, driving a dynamic 0–100 risk score.
- Reduced manual incident response by developing an automated OS-level mitigation engine (Windows netsh / Linux iptables) with a self-healing verification module that scores mitigation effectiveness 0.0–1.0.

Platform Ticket Booking Application

Python, JavaScript, MySQL, HTML/CSS

- Shipped a full-stack ticket-booking platform on a normalized MySQL relational schema with a data-visualization layer covering core booking and reporting flows.
- Mitigated SQL injection and common OWASP Top 10 web risks by applying parameterized queries and server-side input validation.

TECHNICAL SKILLS

- Security Operations:** threat analysis, real-time traffic and alert monitoring, incident triage, vulnerability assessment (VAPT fundamentals), risk scoring and prioritization
- Network Security:** TCP/IP network protocols, network architecture, firewalls (netsh, iptables), intrusion detection (IDS) concepts
- Tools & Platforms:** Kali Linux, Docker, Git,
- Languages & Databases:** Python, Java, C++, JavaScript, SQL; MySQL, MongoDB
- Foundations:** operating systems (Windows, Ubuntu, macOS), malware analysis, digital forensics tools, cloud computing basics

CERTIFICATION

- TryHackMe** — Cyber Security 101 (SEC1)
- NPTEL** — Blockchain and its Applications
- Vityarthi** — Python Essentials; Programming in Java; Fundamentals of AI & ML
- Google** — Google IT Support Certificate
